

# Toilet Repair and Replacement in Utah

 [beehiveplumbing.com /toilet-repair-replacement-utah/](http://beehiveplumbing.com/toilet-repair-replacement-utah/)

## Why Choose Us?

Beehive Plumbing can expertly handle all your toilet repair and toilet replacement needs. We provide dependable and efficient services for residential and commercial customers. However small, or big, the task is, clients can always trust us to do the job right every time. Beehive Plumbing is available 24/7 to cater to your plumbing needs. Contact us anytime, and we will be there ready to bring back the functionality of your bathroom.

## Toilet Repair Services

We provide toilet repair services in both residential and commercial settings. Beehive Plumbing can expertly solve common toilet repairs such as toilet flushing problems (phantom flushing, weak flushing, sluggish flushing, multiple flushes, partial flushing, or complete lack of flushing). We can fix broken handles, water bowl damage, slow tank refills, leaks and drips, and water bowl irregularities. We even get rid of the strange whistling sounds you may be hearing from your taps. We do all this with guaranteed service and reasonable pricing.

## Toilet Replacements and Installations

When repairing a toilet is no longer an option, Beehive Plumbing can determine the best toilet replacement and installations option. Our Utah Plumbers install new basements additions, bathroom remodels, and more. For clients that wish to cut down on their water bills or water usage, Beehive Plumbing can advise on installing a new low-flow or dual flush toilet.

- **Low Flow Toilets:** Low-flow toilets can save you money by using less water. To be considered a low-flow

toilet, it must use 1.6 gallons of water or less per flush. Most toilets use 3.5 – 5 gallons per flush, or about 20 gallons per person, per day! That is more water than any household appliance. New designs have improved performance, and our plumbers can advise you on the best low-flow toilets to cut down on water usage, and lower your water bill.

- **Dual Flush Toilets:** Dual-flush toilets can save water and money. They are built to only use the water required by developing a two-button flush system; a half flush for liquid waste and a full flush for solid waste. Most modern dual-flush toilets use less than a gallon of water.
- **Pressure-Assist Toilets:** Best suited for commercial use or in homes with poor drainpipe carry, these models use the pressure of the water supply to the toilet to compress air in an inner tank. When you flush the toilet, pressurized water is forced into the bowl, blasting waste down the drainpipe.
