## Commercial Water Heaters from Beehive Plumbing

There are two main categories of commercial water heaters. The traditional water heater has a tank that stores hot water which empties when used. After it runs out it needs to be refilled. The relatively newer kind is the commercial tankless water heater, which does not store any water but efficiently heats water as it is used. There are electric and gas varieties of both types of heater.

### Commercial Gas Water Heater:

A commercial gas water heater has the advantage of typically costing less than its electric counterpart. In addition, when the tanks are refilled a gas heater will heat the new water faster.

### Commercial Electric Water Heater:

A commercial electric water heater usually costs less initially than a gas tank heater. However, using electricity to heat the water instead of gas will end up costing more in the long run.

### Commercial Tankless Water Heater:

A [tankless heater](#) can be high powered gas or electric. It is more expensive to install, however, once it is installed it costs less to power than water heaters with tanks. Tankless heaters typically last much longer before needed to be repaired or replaced as well, so the price difference eventually pays for itself.

## Installation vs Repair

Repair can be a good option for certain tanks, but commercial water heater [installation](#) of a new unit can end up being a more economical long term solution. Typically, newer units will use less power and cost less to maintain.
