

Pipe Lining in Utah

 beehiveplumbing.com/pipe-lining-utah/

What is Pipe Lining?

Do you need to repair a broken pipe, but don't want your property torn up?

Instead of replacing the pipe, why not add lining?

Pipe lining is a **quick but lasting solution to pipe damage** that *doesn't disrupt your yard* with our **trenchless lining technique**. The lining is **applied without excavating the pipe**, leaving your landscaping and pavement undisturbed. It also **simplifies the repair process**, saving you time, effort, and money.

At **Beehive Plumbing**, our **professionals** can apply pipe lining in a **quick** and **efficient** manner to our **residential** and **business** customers all over Utah. Our **same-day services** will shore up your plumbing system, which we **guarantee for 50 years**.

Signs You Need A New Lining

The sooner you apply a new lining, the more good it will do. You should thus watch for **common signs of pipe damage**, which include:

- **Higher Spending-** If your water bill inexplicably goes up, [there may be a leak](#).
- **Strange Noises-** Banging, whistling, clanking, or bubbling noises can all come from a cracked pipe.
- **Foul Smells-** If you notice an odor near plumbing fixtures, the pipes may not be carrying sewage out of your home.
- **Pressure Changes-** Leaks can prevent your pipes from providing enough water pressure, or even stop the flow entirely.

How Can Pipe Lining Solve These Problems?

Pipe lining is a **tube made from a flexible substance and covered in resin**. Also known as **cured-in-place piping**, or **CIPP**, the lining is *heated to a flexible temperature, placed inside the damaged pipe, and allowed to cool and harden*. This **fills in the leak**, leaving the pipe *fully functional*.

Because installing lining doesn't require excavating the pipe, there is **little chance of damage to your house, office, or yard**. The epoxy resin used to hold it in place also does not harm the surrounding environment. Best of all, because linings are only a few millimeters in thickness, they do not substantially reduce the flow of water; indeed, their **smoother structure** may actually make it **flow more effectively**.

Why Beehive's Pipe Lining Stands Out

Beehive Plumbing provides the **highest quality pipe lining** to all Utah customers. Our materials are notable for their ability to:

- Stand up to mechanical fatigue
- Resist corrosive chemicals

- Shake off physical impacts
- Remain in good condition regardless of moisture

The Process of Pipe Lining

Beehive Plumbing uses **trenchless techniques** to install pipe lining, sparing your home, office, or yard from disruption. This involves *drilling holes at opposite ends of the damaged pipe and then inserting the lining through those holes*. **This is done through the following steps:**

1. **Inspection-** We begin by using a [camera line to examine the pipe's interior](#). We assess the nature of the damage, as well as how serious it has become. We then determine *what type of lining to use and where it needs to be placed*.
2. **Cleaning-** We [flush clogs, debris](#), and [anything else that might block the lining](#) out of the pipe. This ensures that the resin will stick directly to the interior walls.
3. **Insertion-** We heat the lining and place it in the pipe, making sure that it *sticks directly to the interior walls and covers all of the affected area*. We then *inflate it so that it bonds tightly with the pipe*.
4. **Video Assessment-** Once the lining is in place and fully inflated, we put the camera line back in the pipe and conduct a *second inspection*. This lets us *make sure that the lining has inflated fully, is properly bonded, and does not leave any damage uncovered*.
5. **Release-** At the very end, we let out the air, leaving the pipe in *full working order*. If all the previous steps were followed correctly, *the pipe should stay in good condition for decades*.

This process can correct **cracks, breaks, corrosion**, or virtually any other type of pipe damage. The only pipes it cannot fix are those that have been *crushed*, as they no longer have a round structure to bond the lining to.
